DEEPSTACK The Buildout · Part 15 · Memo

MARKETS

Oil Is the Headline. The Real Yield Is the Bill.

From February 27 to October 8, 2026, the 10-year Treasury yield rose 125 basis points, 115 of them real yield, while breakeven inflation rose 10, by DeepStack's reading of FRED. Retail diesel set a record in the week of September 21, 71% above the week of February 23, by the EIA's survey. The oil shock reaches the AI trade through the Fed and the real yield.

By DeepStack · October 19, 2026 · Markets · 10 min read on the page · deepstack.ltd/stories/oil-is-the-headline-the-real-yield-is-the-bill/

THE DEEPSTACK CALL

Split The trade pays the real yield

Oil reaches the AI trade through the Fed and the real yield while inflation expectations stay put. The multiple shrinks; the trade survives.

Conviction Moderate (3/5) · Version 2 · Oct 19, 2026

WHAT TO DO WITH THIS

1. Split every move in the 10-year into real yield and breakeven: from Feb 27 to Oct 8, 2026, 115 of its 125 basis points were real.
2. Price long-dated earnings against a 10-year at 5.5%, where Howell's Aug 14 projection put the market multiple below 20 times.
3. Count AI borrowing as a rates input: Eisman tied about $500 billion of AI debt issuance to the 10-year's climb on Oct 9.

WHAT WOULD CHANGE OUR MIND

- The 10-year closes at 5.50% or higher with breakeven inflation under its May 4 high of 2.50%: the two shocks compound.
- The 5-year, 5-year forward rate on FRED closes above 2.60%: the shock has reached inflation expectations.
- The Fed holds on October 28 and the real yield closes under 2.50% by December 9: the boom is paying the rate.

THE FULL ARGUMENT

DeepStack's view is that the AI trade survives the barrel and pays for it through the real yield. From February 27 to October 8, 2026, the 10-year Treasury yield rose 125 basis points, 115 of them real yield and 10 breakeven inflation, by DeepStack's reading of FRED; retail diesel rose 71% from the week of February 23 to a record in the week of September 21, by the EIA's survey. The barrel landed on core prices already running hot before the war and gave the Fed one more reason to raise its target range, which it did on September 16; the Fed and the borrowing of the Treasury and the hyperscalers moved the real yield, the rate long-dated earnings answer to. The single most important reason for caution is the core: if diesel reaches core prices, as Torsten Slok of Apollo argued on September 23, expectations follow and the two shocks compound. The view changes if the 10-year closes at 5.50% or higher with breakeven inflation under 2.50%, or if the 5-year, 5-year forward rate averages above 2.60% in March 2027. The first result arrives on October 28, when the Fed decides.

THE DATED TESTS

What would settle it, on the Docket. A test is specified when an outsider can settle it without asking anyone: the question, the source, the rule and what happens if the source is late, revised or silent.

Dec 31, 2026 `p15-t01` PENDING

The 10-year: whether FRED's daily series closes at 5.50% or higher on any business day from October 16 through December 31, 2026, after a 5.31% high on October 5.

Question	Does the 10-year Treasury constant-maturity yield (FRED series DGS10) close at 5.50% or higher on any day from October 16, 2026 through December 31, 2026 for which FRED reports a value?
Source	FRED, Market Yield on U.S. Treasury Securities at 10-Year Constant Maturity (DGS10), Board of Governors of the Federal Reserve System `fred.stlouisfed.org/series/DGS10`
Rule	Read every daily observation of DGS10 dated October 16, 2026 through December 31, 2026, as FRED shows them on January 5, 2027; the days read are the days for which FRED reports a value. The answer is yes if any of them is 5.50 or higher; no if every one is below 5.50. Intraday highs, other maturities and yields reported in the press are read alongside and do not decide the test.
If the source is late, revised or silent	FRED posts each close about one business day later, so the observation for December 31, 2026 is due by January 4, 2027. A weekday FRED leaves blank because the U.S. bond market was closed is not missing and is not read: in this window, Veterans Day (November 11), Thanksgiving (November 26) and Christmas (December 25, 2026), by the holiday schedule of the Securities Industry and Financial Markets Association. Only a weekday on which the bond market was open and FRED still shows no value on January 8, 2027 is missing; if one is, and no observation already in is 5.50 or higher, the test is inconclusive, and the Result says what was read and what was missing; the next reading is January 15, 2027. A close FRED revises before the reading is read as revised; a later revision does not reopen the test.

Jan 12, 2027 `p15-t02` **PENDING**

The barrel: whether the EIA's January outlook puts Brent's fourth-quarter 2026 average above the $105 a barrel it forecast on October 6, 2026.

Question	Does the U.S. Energy Information Administration's Short-Term Energy Outlook of January 2027 put the average Brent crude oil spot price for the fourth quarter of 2026 above $105 a barrel?
Source	U.S. Energy Information Administration, Short-Term Energy Outlook, January 2027 release (energy prices table, quarterly Brent spot average), scheduled for January 12, 2027 `www.eia.gov/outlooks/steo/`
Rule	Read the fourth-quarter 2026 Brent spot average, in dollars per barrel, from the energy prices table of the January 2027 Short-Term Energy Outlook, where the quarter is history. The answer is yes if it is above $105.00; no if it is $105.00 or below. The outlook's forecasts for 2027, futures prices and prices reported in the press are read alongside and do not decide the test.
If the source is late, revised or silent	The EIA schedules the January outlook for January 12, 2027. If it is not published by January 19, 2027, or its energy prices table does not give the fourth quarter of 2026, the test is inconclusive, and the Result says what was read and what was missing; the next reading is the February outlook, scheduled for February 9, 2027, which also carries the quarter as history. Figures are read as first published in the release read.

Apr 1, 2027 `p15-t03` **PENDING**

Expectations: whether FRED's 5-year, 5-year forward inflation rate averages above 2.60% in March 2027, from 2.32% on October 9, 2026.

Question	Does the 5-year, 5-year forward inflation expectation rate (FRED series T5YIFR) average more than 2.60% over the days of March 2027 for which FRED reports a value?
Source	FRED, 5-Year, 5-Year Forward Inflation Expectation Rate (T5YIFR), Federal Reserve Bank of St. Louis `fred.stlouisfed.org/series/T5YIFR`
Rule	Average the daily observations of T5YIFR dated March 1 through March 31, 2027 for which FRED reports a value, as FRED shows them on April 1, 2027, rounded to two decimals. The answer is yes if the average is above 2.60; no if it is 2.60 or below. The 10-year breakeven (T10YIE), surveys of inflation expectations and readings outside March are read alongside and do not decide the test.
If the source is late, revised or silent	FRED posts the series about one business day later, so the observation for March 31, 2027 is due by April 1, 2027. A weekday FRED leaves blank because the U.S. bond market was closed is not missing and is left out of the average. Good Friday, March 26, 2027, is expected to be such a day: not a federal holiday, but a bond market close on the holiday schedule of the Securities Industry and Financial Markets Association, which FRED left blank in 2024 and 2025; the Result names every weekday left blank and why. Only a weekday of March on which the bond market was open and FRED still shows no value on April 8, 2027 is missing; if one is, the test is inconclusive, and the Result says what was read and what was missing; the next reading is April 15, 2027. Observations FRED revises before the reading are read as revised; a later revision does not reopen the test.

Mar 31, 2027 p15-t04 PENDING

The trade: whether the Thrift Savings Plan's C Fund, an S&P 500 index fund, closes 10% or more below its highest close since October 16, 2026, on any day through March 31, 2027.

Question	Does the C Fund of the Thrift Savings Plan, the federal employees' S&P 500 index fund, close at or below 90% of its highest closing share price since October 16, 2026, on any business day from October 16, 2026 through March 31, 2027?
Source	Thrift Savings Plan, share price history of the C Fund (daily closing share prices, tsp.gov) www.tsp.gov/share-price-history/
Rule	Read the C Fund's daily share prices from October 16, 2026 through March 31, 2027 in the plan's share price history. For each day, take the highest price from October 16, 2026 through that day. The answer is yes if on any day the price is at or below 90% of that running high; no if it never is. The fund holds the stocks of the S&P 500 and reinvests their dividends, so its share price is the record the test reads; the index itself and the plan's other funds are read alongside and do not decide the test.
If the source is late, revised or silent	If the plan has not posted the prices through March 31, 2027 by April 7, 2027, the test is inconclusive, and the Result says what was read and what was missing; the next reading is April 14, 2027. A price the plan corrects is read as corrected.

THE TEST CAME IN

No test from this Part has resolved yet. Results are promoted by a person and listed on the Results page.

How DeepStack settles a question

Every Part of The Buildout asks one question and gathers the strongest case on each side from named investors and analysts, attributed, dated and linked. DeepStack then takes a side in The DeepStack Call, names what it would take to change its mind, and sets dated tests that an outsider can read on the day. When a test comes in, the result is published with its evidence, confirmed, refuted or inconclusive, and the Call's history records when the house changed its mind and why. No person is scored or ranked. No accuracy rate is shown until ten results exist.

Quoted passages are short, attributed by name and linked to their source; the paraphrases are DeepStack's. Quote this memo with attribution and a link to the canonical page.

This memo reflects the page as of October 19, 2026. Canonical page: https://deepstack.ltd/stories/oil-is-the-headline-the-real-yield-is-the-bill/. Who is on each side: https://deepstack.ltd/sides/oil-is-the-headline-the-real-yield-is-the-bill/.

Analysis and opinion, not investment advice.
